You can format the line of a text message, as is done in the QR symbol to the left, by using `\n` (new line) within the required argument of `\qrCode`.

Medium

(MECARD)

Large

(Now is the time...)

This is an example of a QR symbol containing text. This paragraph is near the limit of 500 characters. If you recompile after un-commenting the one line that is commented out, you'll be over the 500 character limit. See what happens when you compile. This example as well as others were used in the development of the package to check whether there truly is a 500 character limit.
